

Example [\[edit \]](#)

Given a network of seven nodes, source A, sink G, and capacities as shown below:

In the pairs f/c written on the edges, f is the current flow, and c is the capacity. The residual capacity from u to v is $c_f(u, v) = c(u, v) - f(u, v)$, the total capacity, minus the flow that is already used. If the net flow from u to v is negative, it *contributes* to the residual capacity.

Capacity	Path	Resulting network
$\min(c_f(A, D), c_f(D, E), c_f(E, G))$ $= \min(3 - 0, 2 - 0, 1 - 0) =$ $= \min(3, 2, 1) = 1$	A, D, E, G	
$\min(c_f(A, D), c_f(D, F), c_f(F, G))$ $= \min(3 - 1, 6 - 0, 9 - 0) =$ $= \min(2, 6, 9) = 2$	A, D, F, G	
$\min(c_f(A, B), c_f(B, C), c_f(C, D), c_f(D, F), c_f(F, G))$ $= \min(3 - 0, 4 - 0, 1 - 0, 6 - 2, 9 - 2) =$ $= \min(3, 4, 1, 4, 7) = 1$	A, B, C, D, F, G	
$\min(c_f(A, B), c_f(B, C), c_f(C, E), c_f(E, D), c_f(D, F), c_f(F, G))$ $= \min(3 - 1, 4 - 1, 2 - 0, 0 - (-1), 6 - 3, 9 - 3) =$ $= \min(2, 3, 2, 1, 3, 6) = 1$	A, B, C, E, D, F, G	

Notice how the length of the [augmenting path](#) found by the algorithm (in red) never decreases. The paths found are the shortest possible. The flow found is equal to the capacity across the [minimum cut](#) in the graph separating the source and the sink. There is only one minimal cut in this graph, partitioning the nodes into the sets $\{A, B, C, E\}$ and $\{D, F, G\}$, with the capacity

$$c(A, D) + c(C, D) + c(E, G) = 3 + 1 + 1 = 5.$$
